

# Starter Activity

**Think back to Week 3 and your early JavaScript sessions.**

**I would like you to write a short sentence or two, summarising your understanding of an "If / Else" Statement.**

**Type your answer in the Teams chat but do not press enter until instructed.**

# Python

## Conditional Statements

# Session Expectations:

- Cameras on 
- Mics muted 
- Raise Hand 
  - React 
  - Respond **"?"**

# Learning Objectives

- 
- **Intent:** To explore how **conditional statements** work in Python.
  - **Implementation:** To **control** the **flow** of our code by appropriately embedding conditional statements.
  - **Impact:** To contextualise **how, when** and **why** conditional statements should be implemented.

# Python Conditional Statements

**In both JavaScript and Python, conditional statements perform the same function, executing code based on whether a condition is true or false. The only difference is in syntax.**

# JavaScript vs Python Syntax:

 example.js

```
if (x > 10) {  
    console.log("x is greater than 10");  
} else {  
    console.log("x is 10 or less");  
}
```

 example.py

```
if x > 10:  
    print("x is greater than 10")  
else:  
    print("x is 10 or less")
```

**JavaScript** uses parentheses  
and curly braces.

While **Python** uses colons  
and indentation.

Other than the syntax  
differences, the idea is the  
exact same.

# Session Topics:

- If Statement
  - If...Else Statement
- If...Elif...Else Statement
  - Match Case (Switch)

**Let's move over  
to VS Code to  
work through  
some examples**
